**1975Se13:** (pol d,t): E=14.83 MeV beam was produced from the Notre Dame Lamb-shift ion source. Target was chemically pure natural argon gas. Reaction products were detected with  $\Delta E$ -E counter telescopes (FWHM=120 keV) of surface-barrier detectors and Si(Li) detectors. Measured  $\sigma(E_t, \theta)$ , analyzing powers. Deduced levels, J,  $\pi$ , L-transfers, spectroscopic factors from DWBA analysis. Comparisons with available data.

**1966Ro02:** E=15 MeV deuteron beam was produced from the cyclotron at the University of Pittsburgh. Target was argon gas. Reaction products were momentum-analyzed with a magnetic spectrograph (FWHM=75 keV) and detected with a CsI(Tl) crystal. Measured  $\sigma(E_t, \theta)$ , relative yields. Deduced levels, J,  $\pi$ , L-transfers from DWBA analysis.

**1968Fi05:** (d,t): E=11.6 MeV. Measured  $\sigma(E_t, \theta)$ . Deduced levels, J,  $\pi$ , L-transfers, spectroscopic factors from DWBA analysis for 0, 1270, 1520 levels and a group at 2200.

**1965Ja07:** (d,t): E=11.8 MeV. Measured  $\sigma(E_t, \theta)$ . Deduced levels, J,  $\pi$ , L-transfers, spectroscopic factors from DWBA analysis for 0, 1270, 1520 and 2370 levels.

 $^{39}\text{Ar}$  Levels

Spectroscopic factor  $C^2S$  is obtained from  $(d\sigma/d\Omega)(\exp)=N \times C^2S \times (d\sigma/d\Omega)$  (DWBA), with N=normalization factor. N=3.33 is used in [1975Se13](#) and [1968Fi05](#).

<sup>†</sup> From [1966Ro02](#), unless otherwise noted. In the region 1530-3410, the energies seem to be systematically higher (by 13-30 keV) as compared to those in Adopted Levels. There may be a possible calibration problem in this energy region.

<sup>‡</sup> From figure 2 of [1975Se13](#).

# From [1975Se13](#).  $J^\pi$  assignments are based on L from  $\sigma(\theta)$  and L+1/2 transfer from analyzing powers, unless otherwise noted.
